Events-Based Record Keeping Chart

Event	Product(s)	Group Skills	Work Skills
Lesson 1-1: <i>Seeing with your hands</i>			
Lesson 1-2: <i>Seeing too much</i>			
Lesson 1-3: <i>Seeing through shape</i>			
Lesson 1-5: <i>Seeing through arms and legs</i>			

Objectives-Based Record Keeping Chart

Dates Observed	Objectives
	G8. classifies 3-D objects by using objects to name prisms, pyramids, cones, cylinders, spheres
	D13. constructs graphs
	P21. does a simpler but related problem (constructs a model)
	M15. uses appropriate standard measuring units for length

The Vowel Gang

Slowly, with shaking fingers, he climbed over the three metre iron railings enclosing the property. He had a good idea that there were no dogs or security alarms that would give warning of his intrusion. Nevertheless, he had to force himself to be patient, not to rush and do something stupid. Still his hands quivered as he gripped the cold iron.

A small light flickered in one of the windows facing the railing. Or was it his imagination? This was awful! Now he was seeing things that just weren't there. But there it was again. Was someone looking at him perched on top of the fence? He felt like jumping off and running away. There was no one there. How could there be? No one was supposed to be home.

The moon peeked out from behind the cloud. He felt naked, like a sitting duck in a shooting gallery. Quickly he slid down the other side of the railing glad to have his feet firmly on the ground. He tiptoed round the mansion trying not to make any noise, finally coming to a stop under the basement window which he knew was left unlocked.

Exhibition 1-3: Seeing Square Numbers

Seeing is believing—Would the real square numbers please step forward!

1. Legend has it that square numbers are pretty square. If you were to interview adults about square numbers, most of them would tell you that it is **obvious** that:

- the square numbers are

$$1 \times 1 = 1$$

$$2 \times 2 = 4$$

$$3 \times 3 = 9$$

$$4 \times 4 = 16$$

...and so on.

2. Unknown to most adults is the surprising fact that these numbers often go about in **disguise**.

The Problem: To find out what square numbers really look like.

To get the investigation started:

- This presentation provides 3 Exhibits of information.
- Each Exhibit provides different evidence about the real shape of "square numbers."
- The evidence provided in each Exhibit is incomplete.
- Overall the evidence is somewhat confusing.

In order to solve the problem, consider the evidence, complete it where necessary, analyze the evidence, use your powerful intelligence, come up with some answers.

Extra challenge: Can square numbers disguise themselves as pentagons, hexagons, octagons, or parallelograms?

Exhibit 1-3a: Seeing Square Numbers as Squares

The first two square numbers are 1 and 4, and the exhibit shows them looking very square.

Complete the sketches for the next two square numbers to satisfy yourself that they are square too.

1

4

9

16

Are these the real square numbers, or are they just disguised to make them look square?

Exhibit 1-3b: Seeing Square Numbers as Triangular

So, are the square numbers **really** square? Or are they triangular? What do square numbers really look like? Which is the disguise?

Exhibit 1-3c: The *Real* Square Numbers are Trapezoidal

This Exhibit shows the square numbers in trapezoidal clothing because they really are trapezoidal! (But be careful — more than one detective has fallen for false evidence! Or failed to recognize the truth staring him/her in the face!) How would the other square numbers look in trapezoidal clothing?

1 4 9 16

Now back to the problem: Would the real square numbers please step forward!

As number detectives who can see beneath "facial" appearances, how can you solve this problem? Are the square numbers really square? Are they masters of disguise? What is real? What is disguise? How can a detective see through "appearances?"

Seeing with Chairs

Jerry's Java Joint is having hard times — people just aren't stopping in to chat and have coffee. Jerry is convinced that the seating arrangements in his joint are the problem. He has been looking at some creative table shapes — triangular and trapezoidal, parallelogram shaped, hexagonal — as well as the traditional square.

He is thinking of installing tables built up from placing single tables side by side. For example, tables built up by placing triangle tables side by side could look like this:

Tables built up out of trapezoids might look like this:

He is thinking of more complicated tables as well, although an 18-chair table is about as big as he would like to go. He is interested in tables that would seat from 4 to 18 people.

Investigative problem:

- What are the possible tables he could try?
- Which of these tables would you recommend?

Getting started:

- Make a plan for starting your investigation
- Check it out with the Chief Detective

Guiding question:

- How can you visualize the tables? Would your cardboard cut-outs help?

Calculating Mileage

Description:

1. Sometimes detectives solve very routine problems like finding out how many kilometres they drive in a week because the agency covers their driving expenses. Detective Drivenlee has been working on several cases which means she has had to drive between several towns near her agency. A good detective, she has a clear map of the area (Exhibit 2-1A: Route Map).
2. Last week her note book contained these entries:
 - Wolf to Madison
 - Madison to Palma
 - Palma to Sedworth
 - Sedworth to Underhill
 - Underhill to Timber
 - Timber to Wolf
4. If her agency pays 1 cent for every 100 metres driven, how much should she be paid to cover the costs of her driving last week?

3. Where is her agency located?

Investigation Tools:

1. Exhibit 2-1A: Route Map
2. ruler
3. calculator (optional)

Seeing Through Arms and Legs

In order to make accurate descriptions, detectives need to be able to estimate heights, distances, weight, size, and so on with accuracy. They must be able to detect even small differences in size.

Test out the keenness of your vision. In each scene two stick men are presented. Your job is to determine by looking which one has the longer body. They are trying their best to distract you by waving their arms and legs!

Test out the accuracy of your eyes by using a ruler. Record your observations.

Mugline 1: Length of body segment AB _____ Length of body segment CD _____

Mugline 2: Length of body segment AB _____ Length of body segment CD _____

Mugline 3: Length of body segment AB _____ Length of body segment CD _____

Mugline 4: Length of body segment AB _____ Length of body segment CD _____

What conclusions can you draw from this case?

How can this case help to make us better detectives?

Mugline Game

Detectives will have made many valid and many invalid nets for the hexahedron. These can be used to play a "Mugline Game."

If detectives are grouped into teams of 4 or 5, then each team can select a set of 4 or 5 nets only one of which is valid. Teams can then take turns forming a "Mugline" at the front of the room with each team member holding a net. The task for the rest of the teams is to decide which Mugline member is holding a hexahedron in disguise.

"What's My Mugline?"

Materials

- A collection of BlockHeads (approximately 12)
- A set of cards showing sketches of six BlockHeads arranged in a Mugline (approximately 15)

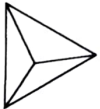

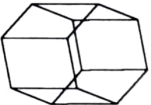

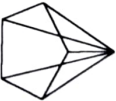

Directions

One detective selects a card showing a mugline and the other has a set of Blockheads. The detective with the card tries to communicate information to the other detective so that he or she can arrange the BlockHeads into the same Mugline as shown on the card. The only information that can be given is information about edges, vertices, and faces.

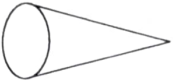

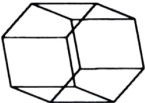

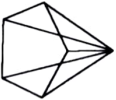

E.g., *"The first BlockHead in the line has 6 square faces and each vertex is a square corner."*

This activity could be turned into a game somewhat like *Pictionary* where two teams play against each other to see which can form the Mugline first.

Lesson 2-3: <i>Check the Cashiers</i>			
Lesson 2-5 ... <i>Optional cases</i>			

Route Map

Sabotage at the Ice Cream Plant

Description:

1. The Ice Cream bandit was at it again. He hates ice cream and just hates seeing kids enjoying a double scoop of wild blueberry ice cream. He hates it even more when they smack their lips. Last night he was at work again trying to spoil the ice cream at the Ice Cream Plant. The investigating officer responded to a call last night just after midnight. He had scribbled rough notes as follows:

"Arrived at the Plant shortly after midnight at 00 15 58.

Each ice cream Vat had been shut down - the power switches were each shut off.

The thermometers in each Vat had different readings. Must remember to photograph each thermometer with my infrared camera because it is too dark to accurately read each one.

I wonder - Can I figure out the path the Bandit took as he went from one vat to another? If so I may be able to figure out which door was likely left unlocked."

2. Exhibit 2-2A1: "Melting Ice Cream" shows the sketches made from the photos of the thermometers. Exhibit 2-2A2: "Layout of the Ice Cream Vats" shows the location of the Vats in the Plant. What path did the Bandit take through the plant?
3. Which entry did he likely use to get in?
4. If he was in a hurry, which entrance did he likely leave by?

Investigation Tools:

1. Exhibit 2-2A1 Melting Ice Cream
2. Exhibit 2-2A2 Layout of the Ice Cream Vats

Objectives-Based Record Keeping Chart

Dates Observed	Objectives
----------------	------------

M-27. estimates and measures mass (grams)

M-29. uses appropriate standard measuring units for mass: g

M-35. reads the Celsius thermometer, and uses the symbol °C

M-36. determines the reasonableness of Celsius thermometer readings in a situation

P-13. knows what information is extraneous

P-24. works problem backwards

Check the Cashiers

Description:

1. The owner of the local corner grocery store has contacted us. At the end of the day there always seems to be a shortage of cash in the till. Two cashiers work at the store. They both seem honest but mistakes are being made (hopefully not on purpose). Random checking of their handling of sales has produced a record of transactions (See "Evidence Sheet"). Do these slips tell us anything about what might be going wrong?

Investigation Tools:

1. **Evidence Sheet 2-3A** (2 pages): *Cashier Transactions*
2. Calculators (optional)

Cashier Transactions

Teller 1		Money given	Change
ketchup	\$2.69		2 pennies
tuna	\$1.49	\$6.00	1 nickel
juice	\$.99		3 quarters
TOTAL:	<u>\$5.17</u>		
apples	\$1.49		4 pennies
peanuts	\$1.49	\$6.00	1 nickel
muffins	\$1.09		1 dime
onions	\$1.49		1 quarter

radishes	\$.89	1 quarter
cake	\$3.09	1 nickel
TOTAL:	\$9.32	
bags	\$1.39	4 pennies
crackers	\$2.89	1 loony
cookies	\$3.49	
salami	\$1.19	
TOTAL:	\$8.96	

Topping Down the Slurpy

Description:

1. Several customers have been complaining that a local slurpy dealer has been short-changing his thirsty customers by using containers that hold less than indicated. A selection of containers that he uses, each labeled as to size, has been gathered from his establishment. Is he an honest merchant?

Investigation Tools:

1. labeled containers
2. graduated cylinders
3. water

Case of the Mixed-Up Boxes

Description:

1. Our client, a Grade 5 teacher, Mr. McMillan, had prepared carefully for his mathematics lesson. He had divided a number of articles into two boxes. One box contained articles that weighed less than one gram; the other box contained articles that weighed more than one gram. When he arrived for class next day, the boxes had been overturned and the contents mixed together.
2. Mr. McMillan called in a request to our Detective Agency:
 - a. Can we re-sort his boxes on time for his mathematics class?
 - b. What would we be able to do to find out WHO did it?

Investigation Tools:

- scales to measure about one gram
- Exhibit 2-5A: Mixed-up Mathematics

Exhibit: Mixed-Up Mathematics

[illegible]

FlatHead Game

"What's My FlatHead?"

Materials

- geoboard and elastics
- cards showing a polygon (FlatHead) constructed on a geoboard

Directions

One detective selects a card, the other has a geoboard with elastics. The detective with the card gives descriptive information so that the other can construct the Flathead on the geoboard.

This activity could be organized as a game with teams somewhat like *Pictionary* where instead of drawing the item, the player must give verbal descriptions.

Objectives-Based Record Keeping Chart

Dates Observed	Objectives
	M-8. reads and writes time, using standard notation to the nearest: second
	M-15. uses appropriate standard measuring units for length
	M-17. expresses linear measures to the nearest thousandth of a metre by using manipulatives, where appropriate
	M-29. uses appropriate standard measuring units for mass: kg, t
	M44. finds and compares the perimeter of polygons by using manipulatives and diagrams (no formulas) in a problem-solving setting
	M45. uses manipulatives and diagrams (no formulas) in a problem-solving setting to find and compare the area of rectangles
	M46. demonstrates understanding of the relationship between perimeter and area by using manipulatives and diagrams to make rectangles: <ul style="list-style-type: none"> • having the same perimeter but different areas • having the same area but different perimeters
	G-7. classifies and names two-dimensional figures as pentagons, hexagons, octagons
	G-8. using nets to name: prisms, pyramids according to the types of bases
	G-16. demonstrates understanding of symmetry through identifying symmetric figures and drawing lines of symmetry on two-dimensional figures
	G- 17. drawing and identifying translations (slides) of two-dimensional figures

Objectives-Based Record Keeping Chart

Dates Observed	Objectives
	G-18. demonstrates understanding of rotations (turns) by manipulating 2-dimensional figures
	P-1. demonstrates willingness to find a solution to a problem
	P-2. perseveres in finding a solution to a problem
	P-3. demonstrates flexibility in finding solutions to problems
	P-5. works both independently and in a group situation
	P-8. interprets pictures and diagrams
	P-10. restates the problem in own words
	P-11. knows what information is implied
	P-12. knows what information is missing
	P-13. knows what information is extraneous
	P-14. uses logical reasoning

Objectives-Based Record Keeping Chart

Dates Observed	Objectives
	P-17. looks for and continues patterns
	P-18. draws pictures and diagrams
	P-21. does a simpler but related problem
	P-24. works backwards
	P-25. states the answer(s) to the problem
	P-26. determines if the answer is reasonable
	P-27. discusses the solution process with others
	P-28. looks for other ways to solve the problem
	P-30. does similar problems
	P-31. alters the problem and finds the effect
	P-33. creates problems that exemplify the concepts learned.
